

Stock that reorders itself.

Smart Weight Systems weighs your inventory around the clock. When a bin drops below its reorder point, your vendor receives the order automatically. No counts, no calls, no empty shelves.

Manual counts miss things.

Clipboards, spreadsheets and weekly walk-arounds leave gaps. Between counts, stock runs out, rush orders cost more, and staff spend hours checking shelves instead of running the business.

Stockouts

Production stops or customers wait while you chase a delivery.

Over-ordering

Buying “just in case” ties up cash and shelf space.

Lost time

Counting and reordering by hand takes hours every week.

How it works

Five steps, all automatic once you set your reorder points.

1 Items sit on smart weight sensors

Load-cell platforms under each shelf, bin or pallet measure weight continuously.

2 Weight becomes stock count

The system knows the weight of one unit, so it converts the reading into how many units remain.

3 You set the reorder point

Choose the level and order quantity for each item, or let the system suggest them from usage history.

4 Low stock triggers the order

When weight falls below the reorder point, the system sends a purchase request straight to the assigned vendor.

5 Vendor confirms and delivers

The vendor accepts the order, ships, and the buyer sees status until stock is back on the shelf.

What each side gets

For buyers

Purchasing, warehouse and operations teams

- Live stock levels for every item, on any screen.
- No more shelf checks or end-of-week counts.
- Fewer stockouts and fewer emergency orders.
- Order sizes based on real usage, so less cash sits in excess stock.
- Alerts when consumption changes, or when a delivery is late.
- A clear history of what was used, ordered and received.

For vendors

Suppliers and distributors

- Orders arrive the moment stock is low, with item, quantity and delivery location already filled in.
- Better demand visibility, so you can plan production and routes.
- Fewer rush requests and fewer phone calls to confirm what is needed.
- Steady, predictable reorder cycles from connected customers.
- Fewer order errors, because nobody retypes a part number.
- Stronger customer relationships built on reliable supply.

Built for anything you can weigh.

If it is sold or used by weight or by counted unit, it can be tracked.

Retail stock

At a glance

Sensing	Load-cell weighing platforms for shelves, bins and pallets
Connectivity	[Wi-Fi / Ethernet / cellular: confirm options]
Ordering	Automatic order to vendor by [email / portal / API / EDI: confirm]
Software	Web dashboard with alerts, usage history and reorder rules
Integrations	[ERP / accounting / purchasing systems: confirm]
Capacity and accuracy	[Add weight range and accuracy per platform model]
Setup	[Add installation and onboarding time]

Bracketed items are placeholders. Replace them with your confirmed product specifications before printing.

See it run on your shelves.

Book a demo and we will set up a live bin, so you can watch a low-stock order reach your vendor.
